FARM EMPLOYMENT STILL AT LOW LEVEL

Fewer persons were working on farms on May 1 than the previous record low for that date a year ago, the United States Department of Agriculture reported today. About 10,000,000 persons were employed on farms on May 1 of this year, a decrease of a little more than 50,000 from the same date in 1944. The index of employment was 83 this month, 75 for last month and 84 on May 1, 1944.

Hired workers numbered only 1,864,000 as compared with 1,989,000 on May 1, 1944. This reflects less than the usual seasonal increase during April. Decreases from a year ago were registered in all sections of the country except Middle Atlantic and Pacific Coast States. Farm operators generally continued to report difficulties in securing adequate supplies of farm labor. Many are already trying to make arrangements for the extra help needed when harvest begins. Farmers are again counting upon imported labor and prisoners of war to bear part of the peak harvest load, although these sources have supplied only a very small proportion of the total farm work force.

The early season has permitted considerable progress in spring planting preparations but this advantage is being lost because of wet cold weather in many areas in late April and early May. Work is beginning to pile up. Numbers of family workers have increased a little over a year ago, partially compensating for the scarcity of hired help. Family workers on the first of the month totaled 8,153,000 persons in comparison to 8,079,000 on May 1 a year ago. However, present numbers of family workers are 8 percent below the 1935-39 average. The Middle Atlantic, West North Central and Mountain areas show slight decreases in family workers when compared with a year ago. All other regions are using larger numbers of family workers, with the largest increases in South Central States.

In New England, total farm employment was about 1 percent higher than on May 1, 1944. Seven thousand (4.2%) more workers were employed in this region on the first of this month than a year earlier. This increase more than offset the numerical decline in hired workers, which was off 4,000 or 5 percent from a year ago. Farmers in New England have been able to spread out their field work this spring because of an early season, although frequent rains during the last week in April and the first week in May have hampered operations to a considerable extent. Precipitation during the week ended May 1 checked spring planting in Souther New England. Practically no planting was accomplished during the week in Maine, New Hampshire, and Vermont.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

In the Middle Atlantic States, total farm employment was estimated to be 583,000 on May 1 compared with 580,000 a year earlier. Rains checked field operations rather generally during the week ended May 1, but, fortunately, an early season allowed farmers to begin planting operations sooner this year than last. However, imported workers and school children already are being called upon to help with the spring work load. Rains delayed field work in some areas. High winds in some New York much areas blew out substantial onion acreage, causing an additional need for labor to reseed the crop. Despite the cool spell which followed the unseasonably warm weather of early April, snap beans had been planted by May 1 in New Jersey and tomato setting was well advanced. Potato planting was just about completed during the third week of April; oats had been seeded, and by the first of this month, were well advanced in growth.

Total farm employment in the East North Central States added up to 1,399,000 persons compared with 1,414,000 as of May 1 last year. The decrease of 27,000 in the number of hired hands was partially offset by an increase of 12,000 in the number of family workers employed. Field work was retarded by heavy rainfall in many sections of this region in late April. Indiana and Illinois farmers were rather busy preparing ground for corn and soybeans, in areas where the land was dry enough. In northern Michigan, some farmers had planted potatoes by May 1. Considerable progress was reported in seeding oats in Central Wisconsin, but outside of Wisconsin, above-normal precipitation rather generally slowed spring farm operations.

Cool wet weather also impeded farm activity in many parts of the West North Central region. Only in Iowa, northern Nebraska, and the Dakotas, was substantial progress made during the last week of April and the first week of May with spring planting operations. Farmers were able to rush plowing for corn in Iowa and northeastern Nebraska. Considerable headway was made on this job in the Dakotas, and at the same time, seeding of spring wheat was nearing completion.

Reports from the South Atlantic region show a decline of 17,000 persons from a year ago in total farm employment. Although there have been some reports of farm work lagging because of labor scarcities, favorable weather in this region has enabled farmers to use the available supply of workers to good advantage. Heavy rainfall during the last week of April brought most cultivation and preparation of land to a standstill. Transplanting of tobacco was almost completed in the Carolinas and corn planting had begun as far north as Maryland.

Despite one of the largest regional increases in family workers, total farm employment in the East South Central region showed a slight decrease from a year ago. The 1,482,000 family workers were 2 percent greater than the number for last May, while a 16 percent decrease left the number of hired workers at 173,000. Field operations on May 1 were generally retarded by heavy rainfall in the preceding week.

Total farm employment in the West South Central region was 1,690,000 persons on May 1, an increase of 13,000 over the preceding year. Family labor increased 36,000 to 1,395,000. This was more than sufficient to balance a decrease of 23,000 hired workers during the year. Wet, cool weather had slowed farm work which was behind schedule in most parts of the region. Strawberries in Arkansas and commercial vegetables in Southern Texas were being harvested.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agriculture Economics

Family and hired labor on May 1 both show decreases from the same period a year ago in the Mountain region. Family workers dropped from 300,000 to 295,000 and hired workers from 111,000 to 108,000. Demand for labor was light during most of April. Montana beet growers, however, were having some difficulty locating sufficient out-of-State labor to handle the 1945 crop.

Total employment in the Pacific region was 524,000 workers, an increase of 6,000 over the preceding May 1. Numbers of family workers increased from 311,000 on May 1, 1944 to 313,000 on the first of this month. Hired workers totaled 211,000 compared to 207,000 a year earlier. Farm work was progressing rapidly, except for some delay in pea seeding in Washington. Harvest of the Kern County potato crop in California was underway by May 1.

Farm Wage Rate Enumerations Show Wide Range in Hourly Earnings

Regional differences in average farm wage rates of more than 100 percent were shown by a survey made for the week ended March 24. This was the first of a series of special nationwide/ farm wage rate surveys by the Bureau of Agricultural Economics to secure detailed information on the wage rates and earnings of farm labor during specified weeks. Nearly 20,000 farm operators were interviewed in a representative sample of counties over the entire United States. Of the farm operators interviewed, only about 2,800 reported using hired labor during the survey week. Inquiry was made into wage rates paid, hours worked, cash earnings and perquisites received by workers in their employ.

Averages of various types of cash wage rates, average earnings and hours worked derived from the survey data are included in this report. The material on perquisites has not been analysed except to classify workers into two groups, those receiving and those not receiving two or more meals a day in addition to cash wages. The data presented here are preliminary, and more detailed analysis, including the general nature of perquisites received by hired farm workers, is in progress and will be published later.

The wage rates obtained from this survey are based on actual rates paid by farmers to about 5,000 hired workers, and are not comparable with the regular quarterly series published by the Bureau of Agricultural Economics. The regular series is based on returns received by mail from voluntary correspondents who report on average rates prevailing in their localities.

Cash earnings of all hired labor on United States farms averaged 34.1 cents per hour during the week ended March 24. Earnings for the week averaged \$16.00 per worker, with a 9.4 hour day and 5.0 days worked. Weekly earnings data are wages received for work done on the reporting farm only, and do not include other wages the worker may have received. Cash returns per hour for workers receiving meals were 12.6 cents lower than the 38.7 cents paid workers not receiving meals. However, a longer average day and more days worked brought weekly cash returns of hired labor receiving meals within \$1.00 of the average for the group receiving no meals.

Of the total number of persons hired by farmers 41 percent were employed at day rates. This group contained a large proportion of field hands and sharecroppers hired by the day in the Southern region, for soil preparation and planting of crops. In other regions, day rates are generally used for short time peak jobs, of which there very few in March.

Monthly rates of payment covered 27 percent of the hired hands working on farms. Year-round workers are generally paid by the month in all regions. The North Central showed the highest percentage of monthly hands. Hourly rates, ordinarily used for hiring for short jobs, were fairly important in the Western region, but accounted for only 17 percent of total United States farm employment. Weekly wage rates were important primarily in the Northeast region. For the United States, 11 percent of the total number of hired workers were employed at weekly wage rates. Piece-work rates were paid to less than 5 percent of the workers, as such rates are generally used for types of work that come later in season.

1/ Results obtained from surveys of wage rates and earnings of citrus fruit, strawberry, and vegetable harvesters in selected areas in Florida and Texas have already appeared in the March and April issues of Farm Labor. 2/ Includes the few workers receiving only one meal.

Almost three-fourths of the hired farm labor did not receive meals in addition to cash wages. In the Southern Region, 86 percent of the total hired workers were in this group. In the Northeast and North Central Regions, slightly more than half the workers were given meals. Over half of the workers receiving meals in these two regions were employed by the month.

The Northeast: Cash earnings of hired farm labor during the week ended March 24 in the Northeast ^{1/} averaged 32.4 cents per hour for a 9.8 hour day and a 6.0 day week. Of the workers employed, 73 percent were hired on a monthly or weekly basis. Most of these were doing chores, maintenance and repair jobs on dairy and livestock farms. Little field work was performed during the week, except in the southern part of the region.

Payment on a daily or hourly basis was usually confined to workers on specific short time jobs. About a fifth of the few hands paid daily and hourly wage rates were served meals by farmers. Practically no workers were being paid piece work rates in this region.

Almost half of the workers received meals in addition to cash wages, and their wages were much below those for workers not receiving meals. Average hourly earnings were 21.0 cents with meals and 44.5 cents without meals. On the average, workers receiving meals worked longer hours per day and more days per week than those not receiving meals.

The North Central States: Hired labor employed during the week received an average cash wage of 30.1 cents per hour in North Central States ^{2/}. The work day averaged 10.1 hours during the week in this region, longer than that reported for any other part of the country. Working time during the week averaged 5.7 days. About half the workers employed were month hands; only 8 percent were hired by the week. These groups of laborers were generally hired for the season, but during the latter part of March were mostly employed at odd jobs and livestock care. Some preparation for spring planting was under way in most States, although heavy rainfall delayed field work in Kansas, Missouri, and southern Illinois.

About 40 percent of the hired hands were paid at a daily or hourly rate. Most of the workers in these two groups were employed for specific jobs of short duration. Almost half of the day hands received meals in addition to cash wages.

Hourly earnings of all workers receiving meals averaged 21.7 cents, compared to 40.3 cents per hour without meals. Farm laborers not furnished meals often received other perquisites such as a house, fuel, meat, fruit, use of a garden and other items. As in the Northeast, longer hours per day and a longer work week was reported for workers furnished meals.

The South: Cash earnings of hired farm labor in the South ^{3/} averaged 27.7 cents per hour. Hours worked per day averaged 8.9, but only 4.2 days were worked, on the average, during the week ended March 24. Rainy weather in the East and West South Central areas prevented full-time employment. In contrast to employment practices in the Northeast Region, 73 percent of the workers were hired on a daily or hourly basis. Many kinds of farm work were performed by hired farm labor during the survey week. Preparation of fields for planting, and actual planting of corn, cotton and other field crops were making good progress in many parts of the South. Livestock and poultry care also required some hired labor.

^{1/} New England and Middle Atlantic States.

^{2/} East North and West North Central States.

^{3/} South Atlantic, East South and West South Central States.

About 20 percent of the labor employed received payment on a monthly or weekly basis. Piece work rates were paid only about 7 percent of the hired workers. This type of payment was reported only for tung nut pickers in Florida and workers picking the remnants of last year's cotton crop in Arkansas.

Workers employed in the South generally received no meals in addition to cash wages. Of the workers reported, 86 percent received no meals. Rates with meals and without meals showed less difference than for any of the other regions. Hourly earnings with meals averaged 23.1 cents compared to 28.7 cents without meals. Workers receiving meals in the Southern region apparently were more highly skilled than the general run of field hands and share croppers, who received only a cash wage when working on the home farm of the plantation owner. In addition, workers from the low wage share-cropper area were more heavily represented in the without meals category than in the with meals classification. Hours worked per day and days worked per week were longer for workers receiving meals.

The West: Hourly cash earnings of hired farm labor in the West ^{1/} were 58.7 cents, the highest average, for the week ended March 24, in any of the four regions. Employment on an hourly basis was the most common form of hiring in that region. Hourly workers included 38 percent of the total number of hired workers and was almost entirely on a without meals basis. Daily rates were used in hiring 20 percent of the workers. Some of the hands hired to prune trees in Washington and Utah and sort seed potatoes in Idaho were paid on a daily or hourly basis.

Monthly wage hands made up 36 percent of the total number of hired farm laborers in this region. This was a common method of hiring sheep herders and cow punchers on ranches. Most of their work at the time of enumeration was routine feeding and preparations for calving, lambing, and sheep shearing. Laborers on dairy farms also were frequently hired by the month. About two-thirds of the hired farm labor in the West was not furnished meals in addition to cash wages. Cash earnings per hour averaged 46.9 cents with meals and 65.8 cents without meals. About two-thirds of the workers receiving meals in addition to cash wages were month hands.

RESULTS FROM SURVEYS OF WAGE RATES AND WAGES OF SEASONAL FARM WORKERS
IN SELECTED SPECIAL CROP AREAS OF CALIFORNIA AND LOUISIANA

Wage rates and earnings of vegetable and citrus harvesters in Imperial County, California, week ended March 3, 1945.--Farm workers harvesting vegetables and citrus in Imperial County, California, averaged 76 cents per hour and \$5.90 per day in cash wages during the week ended March 3, 1945. These are results of a special survey made by the Bureau of Agricultural Economics as part of an expanded program of collecting farm wage information. The survey obtained wage data on 786 laborers in field crews harvesting cabbage, carrots, citrus fruit, lettuce, and peas during an active week in the harvest of each of these crops. Over two-thirds of the workers enumerated were Mexican residents of the county, 16 percent were imported workers from Mexico, 13 percent were Filipinos, and only 3 percent were other American whites. Practically all of the harvesters were males.

In most of the operations, workers were paid on an hourly basis, which ordinarily was 60 or 65 cents per hour for common field labor and 75 to 85 cents for jobs requiring more skill. All workers paid by the hour averaged 65 cents an hour, while workers paid on a piece rate basis averaged 89 cents an hour. In jobs such as cutting cabbage and cutting and packing dry-pack lettuce, the expert Filipinos insisted on payment at piece rates, whereas slower cutters were content to work at hourly rates. Members of Filipino crews working at piece rates averaged \$1.40 an hour.

Of all the workers included in the survey, 56 percent had hourly earnings between 60 and 70 cents, with 9 percent making less than 60 cents an hour and 35 percent making 70 cents or more. Differences in time worked per day led to greater variation among the workers in daily than in hourly earnings. Twenty-four percent of all workers had average daily earnings less than 5 dollars, 48 percent averaged between \$5 and \$7 per day, while 28 percent had average daily earnings of \$7 or more.

Wage rates and earnings of strawberry pickers and packers in the major producing area of Louisiana, week ended April 14, 1945.-- Strawberry pickers and packers in the major strawberry producing area of Louisiana averaged 29 cents an hour and \$2 a day during the week ended April 14, 1945, according to a special survey made by the Bureau of Agricultural Economics. The survey obtained wage data on 300 strawberry pickers and packers working on a sample of farms surveyed in Tangipahoa and Livingston Parishes. These two parishes include 85 to 90 percent of the total acreage in the major strawberry producing area of the State. The survey data relate to the week of the season in which the heaviest shipments of strawberries from the area occurred.

Both pickers and packers were paid by piece rates; the average rate for picking a pint box of strawberries was 3.1 cents and the average rate for packing a crate of 24 pints of strawberries was 27.4 cents. Average hourly earnings of workers from these piece rates were about the same, but because the packers averaged slightly longer hours per day and per week, their daily and weekly wages were somewhat higher. The average weekly wage earned by packers was \$13.70, compared with \$11.70 for the pickers. These weekly wages represent earnings from an average of 43 hours work per week. Although the average number of hours worked by pickers per day was only 6.8 hours, since picking must stop in time for berries to be packed on the same day, pickers worked an average of 6.2 days per week.

Most of the strawberry pickers were women and teen-age boys and girls. This accounts in part for the low average earnings, although the 25 males

aged 18-44 included among the pickers averaged only \$2.60 a day and \$15.60 a week. Variation in weekly wages was great among the pickers. Thirty-five percent made less the \$8 in cash wages during the week, 46 percent made between \$8 and \$ 16, while 19 percent made more than \$16 during the week. Although these weekly figures relate only to wages earned by the worker on the reporting farm, they must be approximately equal to the total weekly earnings of the workers, since the average of 6.2 days of work on one farm indicates that there could have been very little shifting of workers from one farm to another during the week.
